

Problem Statement No. 16 – Recipe Preparation Agent

The Challenge

A Recipe Preparation Agent helps users cook meals using only the ingredients they have on hand. By entering available groceries, users receive personalized recipe suggestions using a Retrieval-Augmented Generation (RAG)-based AI system. The agent retrieves relevant recipes and generates step-by-step cooking instructions tailored to ingredient availability. It also recommends ingredient substitutions, cooking tips, and dietary adjustments based on user preferences or restrictions. The solution aims to reduce food waste, save time, and make everyday cooking smarter, simpler, and more sustainable.

Technology Requirements

Use of IBM Cloud Lite services and IBM Granite models is mandatory.
